PRODUCT OVERVIEW

Rugged, Contractor-Friendly Spray Heads for Residential and Commercial Projects

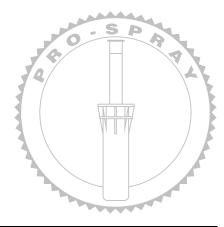

Hunter has created a spray type sprinkler rugged enough to stand up to the needs of a professional contractor. The Pro-Spray®.

Designed for a long life of reliable operation, the Hunter Pro-Spray has been manufactured with the precision required to ensure peak performance for years to come. This solid performer boasts heavy-duty ABS construction, including an extra-thick body and cap previously unheard of in a Hunter spray. A heavy-duty spring promises positive retraction under the toughest conditions. Exclusive body ribs make the Pro-Spray easier to install, adjust, and service while also providing more stability for the sprinkler in loose soils.

But brawn isn't all this product offers. The Pro-Spray also features a user-friendly "pull-up" flush cap that makes installation quicker and easier, and helps keep debris to a minimum. There's also a pressure activated, multi-function wiper seal that eliminates flow-by and allows more sprinklers to be installed on the same zone. Plus, an optional drain check valve for up to 10 feet of elevation change that eliminates landscape damage from flooding and erosion. Add in the Pro-Spray's compatibility with all industry standard female nozzles—as well as Hunter's own complete line-up of adjustable, fixed and specialty nozzles—and you have the industry's most versatile spray sprinkler.

The Hunter Pro-Spray. A spray sprinkler designed with the professional in mind.

PRODUCT FEATURES AND BENEFITS

Anti-drain Check Valve...

Elevation changes are no longer an issue

The Pro-Spray® family anti-drain check valve, which is factory installed or available as an optional part, will hold back 10' of elevation change. When a Pro-Spray body is ordered with the check valve pre-installed from the factory, the words CHECK VALVE are stamped in white lettering on the cap to aid in spray head identification.

This Hunter check valve is unique in this class of spray heads because it may also be field installed after head installation. Contractors or irrigation maintenance personnel will appreciate the fact that if the Pro-Spray is installed without a check valve, but is found to require one at a later date, it can be easily added into the bottom of the riser assembly.

A significant advantage of a spray head check valve is its ability to trap water in the system piping. This substantially reduces wear

on system components by minimizing surges (water hammer) when the valve opens. Also, by stopping low head drainage, the Pro-Spray check valve will put an end to landscape damage caused by flooding and erosion.

No wasteful low-head drainage

Heavy-Duty Body Construction...

Robust design stands up to the competition

The Pro-Spray body has been designed to withstand the harshest environments. The material used to construct the body and cap is super tough ABS plastic that has been molded with dimensions that furnish the high-pressure ratings given to this sprinkler. A multi-thread buttress design is used on the cap (because of its superior strength in cap-to-body gripping capacity) making the head very robust when it comes to withstanding high inlet surge pressures. Also contributing

Heavy duty ribbing

Stands up to heavy equipment

to its outstanding ruggedness, external ribbing is molded into both the body and cap to strengthen the unit against heavy traffic such as riding lawnmowers or other heavy equipment.

Heavy-Duty Spring...

Positive retraction under any conditions

With its heavy-duty, high-grade stainless steel spring, the Pro-Spray provides dependable stem retraction time after time. The spring and multi-function wiper seal work together to assure no more "stick-ups" in harsh environments, eliminating the least effective use of contractors time: the callback. The Pro-Spray spring retraction force is much more powerful than its closest competitor, one of the leading spray heads in the industry.

Ratcheting Riser...

Quick arc alignment

Turning the riser stem on the Pro-Spray by "ratcheting" will quickly and easily align the spray pattern to the correct position. This adjustment can be made while the sprinkler is operating, allowing one to align the spray pattern within the proper boundaries as required.

The Pro-Spray's ratcheting system is an integral part of the body and riser stem. This integration aids in making it a very sturdy and robust ratchet system.

The body of the Pro-Spray also works in conjunction with the ratcheting riser stem by providing six internal ribs which substantially increase the stability of the ratcheting system. With six ribs in the body, riser "walk" (the 'twisting' tendency of the riser, induced by the up and down action of the retract spring) is eliminated.

Multi-function Wiper Seal...

Water efficient and long life

The Pro-Spray comes with a heavy-duty pressure-activated multi-function wiper seal which has been treated with UV inhibitors to insure long life when constantly exposed to the sun's rays. The flow-by is 0 GPM at 10 PSI or greater and only 0.1 GPM otherwise. This no flow-by allows installers to add more heads on the same valve.

The additional wiper seal support in the Pro-Spray helps to ensure strength and reliable performance of the wiper seal under higher pressures. Plus, in the field, the wiper seal can be easily

Seal grips riser at top and bottom—eliminating wasteful flow-by

removed from the cap. This permits easy cleaning or replacement and keeps the benefits of no flow-by during operation as well as a positive retraction every time.

Compatible with All Female-Threaded Nozzles...

Accepts all major brands

The Pro-Spray is fully compatible with all the popular female-threaded nozzles in the industry widely inventoried by contractors. In addition, Hunter's complete line of compatible nozzles, including the

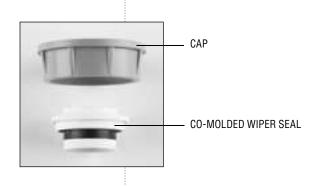

Standard female thread nozzles

adjustable and fixed arcs as well as specialty units such as the Micro-Spray or PCN Bubbler nozzle, are available for a total installation. Now installers can irrigate any landscaped area with the Hunter spray head line.

Handy Flush Plug...

Makes flushing and nozzle installation fast and easy

The Hunter Flush Plug is a new innovative design that positively keeps muddy water and debris from entering back into the spray head after flushing is complete. It is designed to open as the stem extends upward and completely close when the stem is in the retracted position.

PRODUCT FEATURES AND BENEFITS (continued)

The flush plug allows the flushed water to escape only in one direction, which is ideal when trying to keep water off of buildings, cars and sidewalks. It also allows only a limited amount

Directional flushing action

of water flow to pass through it, permitting a controlled directional flushing. This limited flow allows the riser assembly to fully pop up during system flushing for maximum flushing

Handy pull-ring flush cap

action. Another convenient feature installers will benefit from is a pull ring that allows for effortless pull up of the riser stem, making installation of nozzles easier and quicker.

Standard Side Inlet...

Installation convenience for deep-seated bodies

The 6 and 12-inch models come with a standard ½" side-inlet for installation in shallow depth trenches making retrofits or new

installations easy to accomplish. The side plug is removable and placed in the bottom inlet for quick versatility in challenging sites.

Side inlet reduces digging

Optional Black Rubber Cap Cover...

Ideal for high traffic and play areas

Now, all your Hunter sprinklers on the project can provide a degree of protection in high traffic or play areas when the spray head rubber cover is used on the Pro-Spray[®]. This rubber cover serves the same function as the rubber cover on the rotors. An important feature to those who come in contact with the top of the sprinkler in an abrupt manner. This black spray head rubber cover is field-installable and may be ordered using P/N 469805.

Reclaimed Water I.D...

Options for effluent water use

Watering with reclaimed water? Ask for the field-installable purple Hunter spray head body cap (P/N 458520) for permanent and confident identification. The cap can easily be screwed onto Pro-Spray bodies before

installation. Or ask for the field-installable purple Hunter spray head cap cover (P/N 469800) for quick and confident identification. The cover can easily be snapped on to ProSpray body caps either before or after installation.

Date Coding...

Identify exactly when the spray head was manufactured

Hunter spray heads including the Pro-Spray have the manufactured date code molded on the top of the cap near the wiper seal. The date is molded as a 4-digit code, the first two digits representing the quarter, the last two digits indicating the year (e.g., 02 05 stands for 2nd Quarter 2005).

PRODUCT OVERVIEW

When spray sprinklers are used in irrigation systems, fast and easy installation are two of the most important concerns for the installer. And, both of these concerns are put at ease when the installer chooses to use one of the many choices of Hunter spray nozzles. Whatever the particular landscape need, Hunter has the nozzles that can do the job best. In fact, any spray head body that uses female-threaded nozzles (whether a Hunter spray body or a competitor's) can have the ultimate in versatility with a Hunter nozzle.

Adjustable Arc Nozzles: The Ultimate in Convenience. Hunter's famous patented Adjustable Arc nozzles are fully adjustable from 25° to 360°, thus virtually every landscape need can be met. The nozzles are available in radius ranges of 8', 10', 12', 15', and 17', (2.4 m, 3.0 m, 3.7 m, 4.6 m, 5.2 m), and are color-coded in brown, red, green, black, and gray for fast and easy radius identification. The most notable advantage of the Adjustable Arc nozzle is that there is no need to keep an inventory of the many different odd arc nozzles seldom used on jobs.

Pro-Spray Nozzles: Superior Coverage. Hunter's Pro-Spray nozzles are factory set at a quarter, half, or full circle pattern. These nozzles are available in radius ranges of 8', 10', 12', 15', and 17', (2.4 m, 3.0 m, 3.7 m, 4.6 m, 5.2 m), and are also color coded in brown, red, green, black, and gray for fast and easy radius identification. In addition, Hunter now offers a trio of short-radius nozzles in 2', 4' and 6' ranges (0.6 m, 1.2 m, 1.8 m). These new nozzles are just the answer for small spaces that have longed for a better solution than trying to drastically reduce the radius range on a nozzle designed for longer throws.

The clear advantage of the Pro-Spray nozzle is an economic one. When installing nozzles along straight runs or in areas that require full circles, labor will be saved by not having to adjust each nozzle to these common patterns.

Micro-Spray Nozzles: Vandal-Resistant, Low Volume Watering. The unique pop-up design of the Hunter Micro-Spray Nozzle, coupled with the fact that it attaches directly to a female-threaded pop-up spray sprinkler, makes this alternative to drip a winner. When not in use, both the nozzle and the spray head body retract, so nothing sticks up above the surface. And when it's in operation, the pop-up nozzle gives nearly an extra inch of clearance over plants. With its many body options of various pop-up heights and nozzle selections, the Hunter spray line is a complete line, providing solutions to every landscape spray head application.

Specialty Nozzles: Special Watering Requirements Made Easy. For the specific watering needs of narrow areas of your landscape, Hunter offers a full range of nozzles for specialty applications. Three strip pattern nozzles are available, including a left corner, right corner, and side strip model. For the watering needs of slope or non-turf areas, the S-8A and S-16A nozzles can be used. These nozzles are adjustable-arc stream spray type nozzles providing a multiple stream spray pattern to cover any area from 25° to 360°, up to an 18' radius.

PCN Bubbler Nozzles: The Alternative to Drip. When bubblers are the apparent choice to water plantings, Hunter has a better solution: the PCN nozzle. This nozzle functions like a spray nozzle but operates like a bubbler by placing water around the riser. The PCN nozzle threads directly onto any female-thread pop-up spray head body, allowing it to retract to ground level. The result is no more unsightly bubbler risers sticking up out of the landscape. Because its ability to remain out of sight reduces vandalism and repair, the PCN is your best choice for traditional bubbler applications.

PRODUCT FEATURES AND BENEFITS

Short Radius Nozzles...

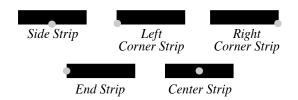

2', 4', and 6' radius for those tight, hard-to-water areas

Hunter now offers a trio of standard quarter and half arc pattern short-radius nozzles in your choice of radius: 2', 4', and 6' (0.6 m, 1.2 m, 1.8 m). These nozzles are just the answer for small spaces that have longed for a better solution than trying to drastically reduce the radius range on a nozzle designed for longer throws. Quarter and half only.

Strip Pattern Nozzles...

Narrow areas, no problem

To accommodate the needs of those long, narrow planting strips, we offer the industry's widest variety of nozzle solutions, including 5' x 15' corner and end strips, 5' x 30' and 9' x 18' side strips, and a 5' x 30' center strip. The radius of these nozzles can be adjusted down 25% without loss of an efficient pattern distribution. And, no matter which nozzle you choose, each is an excellent problem solver for keeping your irrigation needs under control in tight areas.

Stream Spray Nozzles...

Customized low application rate arcs

Hunter also offers two dial-setting, adjustable arc stream spray nozzles that throw as far as 18' (5.9 m) at 30 PSI (206 kPa), combining the convenience of customized arc selection with a lower application rate. The stream spray is an outstanding nozzle to use on slopes and ground cover areas with tight soils as these applications typically require low precipitation rate nozzles.

180°

Filter Screen...

Large surface area

Along with every nozzle comes a large filter screen that prevents clogging from debris in the water, ensuring uniform coverage. This filter is easy to install; it drops in from the top.

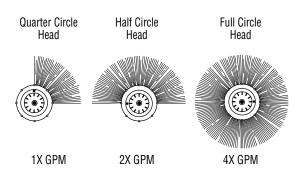

Matched Precipitation...

Even distribution of water regardless of the arc

In properly installed irrigation systems, quarter-, half-, full-, and odd arcs are designed to be used on the same zone. Hunter spray nozzles produce true matched precipitation across most popular arc and radius ranges, with even distribution of water regardless of the arc. This allows for efficient, even distribution of water throughout the entire area. Hunter's matched precipitation nozzles increase customer satisfaction by providing a greener, healthier landscape.

Matched Precipitation Rate Sprinklers

Radius of each sprinkler is equal

PRODUCT FEATURES AND BENEFITS (continued)

Standard Female Threaded Design...

Compatible with the most popular brands

A variety of spray sprinkler bodies on the market today require a female threaded nozzle. All Hunter spray head nozzles meet that standard and are completely compatible with most major brands. This makes the nozzles ideal both for new installations and service of existing systems.

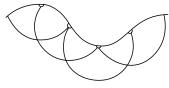

Adjustable Arc Nozzles...

Quick and easy;

performance at its max

With an easy turn by hand, you can change the Adjustable Arc nozzles to keep the spray in the areas as designed. Fine-tuning can be made anywhere from 25° to 360°.

A particularly appealing feature of the Hunter nozzle is that no tools are required to adjust the arc.

The Adjustable Arc nozzle can be used for any area including areas that require custom odd arcs.

Pro-Spray® Nozzles...

Save time, save money

For contractors that desire fixed pattern nozzles, Hunter offers a great array of models which are color-coded for easy identification.

Numerous Radius Ranges of Standard Adjustable and Fixed Nozzles...

Versatile flow and throw

Whether installing Adjustable Arc or a Fixed Arc nozzles, choose from an 8', 10', 12', 15', or 17' (2.4 m, 3.0 m, 3.7 m, 4.6 m, 5.2 m) radius range nozzle to meet the different design applications you might need. The radius can be reduced up to 25% without changing the pattern distribution characteristics.

Micro-Spray Nozzles...

The sensible alternative to drip irrigation

For shrubs and flowerbeds that require 100% irrigated coverage, sometimes a low pressure/low volume irrigation system is not the type of watering you're looking for. With the revolutionary Hunter Micro-Spray Nozzles, excellent coverage with an accurate distribution of water is the norm for a 4-5 foot radius. Contractors will find these Micro-Sprays very user-friendly because of their ability to work under full line pressure and no additional filtration is needed. Unlike regular sprays that discharge a lot of water with higher force, these nozzles send out a finer spray that will not create "run-off" or damage plants. The nozzles attach directly to any Hunter spray body, so no special installa-

tions, such as filters, or retrofits are required. And because the Micro-Spray is itself a pop-up, the nozzle retracts and hides from view when not in usemaking them vandal-proof and creating a more eye-pleasing

appearance.

INSTALLATION AND MAINTENANCE

Installation Instructions

- 1. Install sprinklers onto lateral lines.
- 2. Flush lines, making sure the flush caps are directed away from trench.
- 3. Install screen into riser opening and screw female-threaded nozzle onto riser.
- 4. Adjust arc and radius for each sprinkler as described below.

Arc Adjustment on Nozzles

The Hunter Adjustable Arc nozzles come from the factory with a preset arc of 25°. Before setting the left side of the arc, first set the right ratcheting side by twisting the riser assembly

inside of the sprinkler body, aligning the right side of the spray pattern into the proper area. The raised dot on top of the nozzle indicates the adjustable (left) edge of the spray pattern. Hold the perimeter of the nozzle with

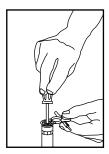

fingers and turn the nozzle counter-clockwise to increase the arc. To decrease the arc, hold the perimeter of the nozzle with fingers and turn the nozzle clockwise, decreasing the arc. The arc can also be increased or decreased by using a flat bladed screwdriver.

Radius Adjustment

Hold the nozzle arc stationary with fingers, or with two pins on the side of the Hunter wrench between any of the nozzle spokes.

Then, adjust the radius with a flat-bladed screwdriver by turning the center screw clockwise.

The radius should not be reduced more than 25%. The nozzles are preset at the factory for maximum radius.

Bubbler Nozzles

PRODUCT FEATURES AND BENEFITS

PCN Bubbler Nozzle...

Out of sight bubbler watering

Hunter has developed the ultimate in deep watering technology with the PCN Bubbler Nozzle. This nozzle is specially designed to screw on to the SRS spray head and most other female threaded spray head bodies on the market today. This means you get all the advantages of traditional flood bubbler watering with a product that retracts into the ground when not in use. Using the PCN Bubbler you will find that the maintenance hassles of other deep watering methods, such as drip, are eliminated. It's the most tamper-proof, eye-appealing method of deep watering available today. With four flow rates to choose from (.25, .50, 1.0, 2.0 GPM; .9, 1.9, 3.8, 7.6 l/min) the PCN can be used in many different soil types with little concern of runoff.

PCB Bubblers...

No need to guess with specific flow rates

For trees and shrubs that are off the beaten path, and for out of the way places, PCB is your low cost deep watering option. The PCB installs quickly and easily to any ½ inch NPT threaded riser or adapter. And, with our line-up of four different PCB models, that means you can select precisely the one you need to meet each of your individual plant's watering requirements. Choose from flow rates of either .25, .50, 1.0, or 2.0 GPM (.9, 1.9, 3.8, 7.6 l/min) to eliminate guesswork and guarantee that all your greenery gets exactly the water it needs.

Choose the AFB model which pressure compensates to a 2.0 GPM (7.6 l/min) flow and can be fine-tuned with a stainless steel screw adjustment.

PRECIPITATION RATE FORMULA

Two formulas are shown below, the first is most useful when comparing precipitation rates between different types of sprinklers or calculating precipitation rates on areas with a single type of sprinkler and uniform head and row spacing. The second method is better suited to areas where sprinkler head flows or spacing varies. Metric versions are shown in parenthesis.

Precipitation Rate - Method #1 - Individual Head Method

$$Pr = \frac{34650 \text{ x GPM (for any arc)}}{\text{Degrees Arc x Head Spacing x Row Spacing}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m) x Row Spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{\frac{1}{\text{min (for any arc)}} \times 21,600}{\text{Degrees of arc x Head spacing (m)}} Pr = \frac{1}{\text{min (for any arc)}} Pr = \frac{1}{\text{min (for any arc)}} Pr = \frac{1}{\text{min (for any arc)}} Pr = \frac{1}{\text{min (for any ar$$

Where:

Pr precipitation rate in inches per hour

GPM flow for a given sprinkler of any arc, in gallons per minute

the arc of the given sprinkler in degrees Degrees Arc **Head Spacing** the space between the heads in a row, in feet = Row Spacing the space between rows of heads, in feet

34650 constant for conversion of area and flow into common units

Example: What is the precipitation rate for a 270 degree sprinkler with 6.8 GPM spaced at 28' by 30'?

$$Pr = \frac{34,650 \times 6.8}{270 \times 28 \times 30}$$
 Pr = 1.04 in./hr.

Precipitation Rate - Method #2 - Total Area Method

$$\begin{array}{ll} Pr &=& \frac{96.25 \ x \ Total \ GPM}{Total \ Area} & \left(Pr &=& \frac{Total \ m^3/hr \ x \ 1,000}{Total \ Area \ (m^2)} = mm/hr \right) \ \left(Pr &=& \frac{Total \ l/min \ x \ 60}{Total \ Area \ (m^2)} = mm/hr \right) \end{array}$$

precipitation rate in inches per hour Pr

Total GPM total flow from all sprinklers in the given area in gallons per minute =

Total Area the given irrigated area in square feet

96.25 constant for conversion of area and flow into common units

Example: What is the average precipitation rate for a section of turf 325' by 80' if the total flow from all sprinklers in the area is 112 GPM.

$$Pr = 96.25 \times 112 (325 \times 80) Pr = 0.41 in./hr.$$

SPRINKLER RUN TIME FORMULA

The sprinkler run time formula calculates the number of minutes required to apply enough water to replace the water lost by evapotranspiration for a specific crop irrigated with a system at a particular precipitation rate and efficiency.

$$T = \frac{60 \times D \times Et_o \times K_c}{Pr \times E_a}$$
Where:

Where:

T = sprinkler run time in minutes

 Et_o reference evapotranspiration rate, in inches =

crop coefficient, percent $K_{\rm c}$

Pr precipitation rate of the area, in inches per hour

 E_{a} = application efficiency of the system, percent

60 Constant for conversion of area, flow, inches per hour and inches per day into common units

D Watering frequency in days

Example: Determine the sprinkler run time for a commercial turf site with an Eto of 0.15 inches per day and a crop coefficient for the cool season turf of 0.90. The sprinkler precipitation rate is 1.50 in./hr. with an application efficiency of 65%. The watering schedule is set for every three days.

$$T = \frac{60 \times 3 \times 0.15 \times 0.90}{1.50 \times 0.65} = \frac{24.3}{.975} = 24.92$$
 $T = 25$ minutes every 3 days
